

# LASIK complications and their management

ESCRS Munich 9.2003

A. John Kanellopoulos, M.D.

*Associate Professor NYU Medical School*

*Director, LaserVision.gr Eye Institute*

**[www.brilliantvision.com](http://www.brilliantvision.com)**

# Case report 1

- 2 years s/p PK
- LASIK for  $-0.50 -9.00 \times 170$
- Epithelial buttonhole in flap
- Reposition of flap, aborted LASIK, but placed relaxing incisions in bed

[www.brilliantvision.com](http://www.brilliantvision.com)

## Case 2

- 56y/oF
- +3.50 OU with keratometry of 46
- Bowman buttonhole with the 130M2 in OS (2nd eye)
- ?management
- Epithelial irregularity for 1 1/2 m
- 4 months 20/25 and 20/25

[www.brilliantvision.com](http://www.brilliantvision.com)

# Flap complications

- Extreme K's : ( $<40$ ,  $> 46$ ), poor suction, pt squeeze, thin flap, large flap diameter
- With compromised Bowman's abort laser
- Careful reposition
- Bandage CL to avoid warpage-beware ingrowth
- May need longer steroids

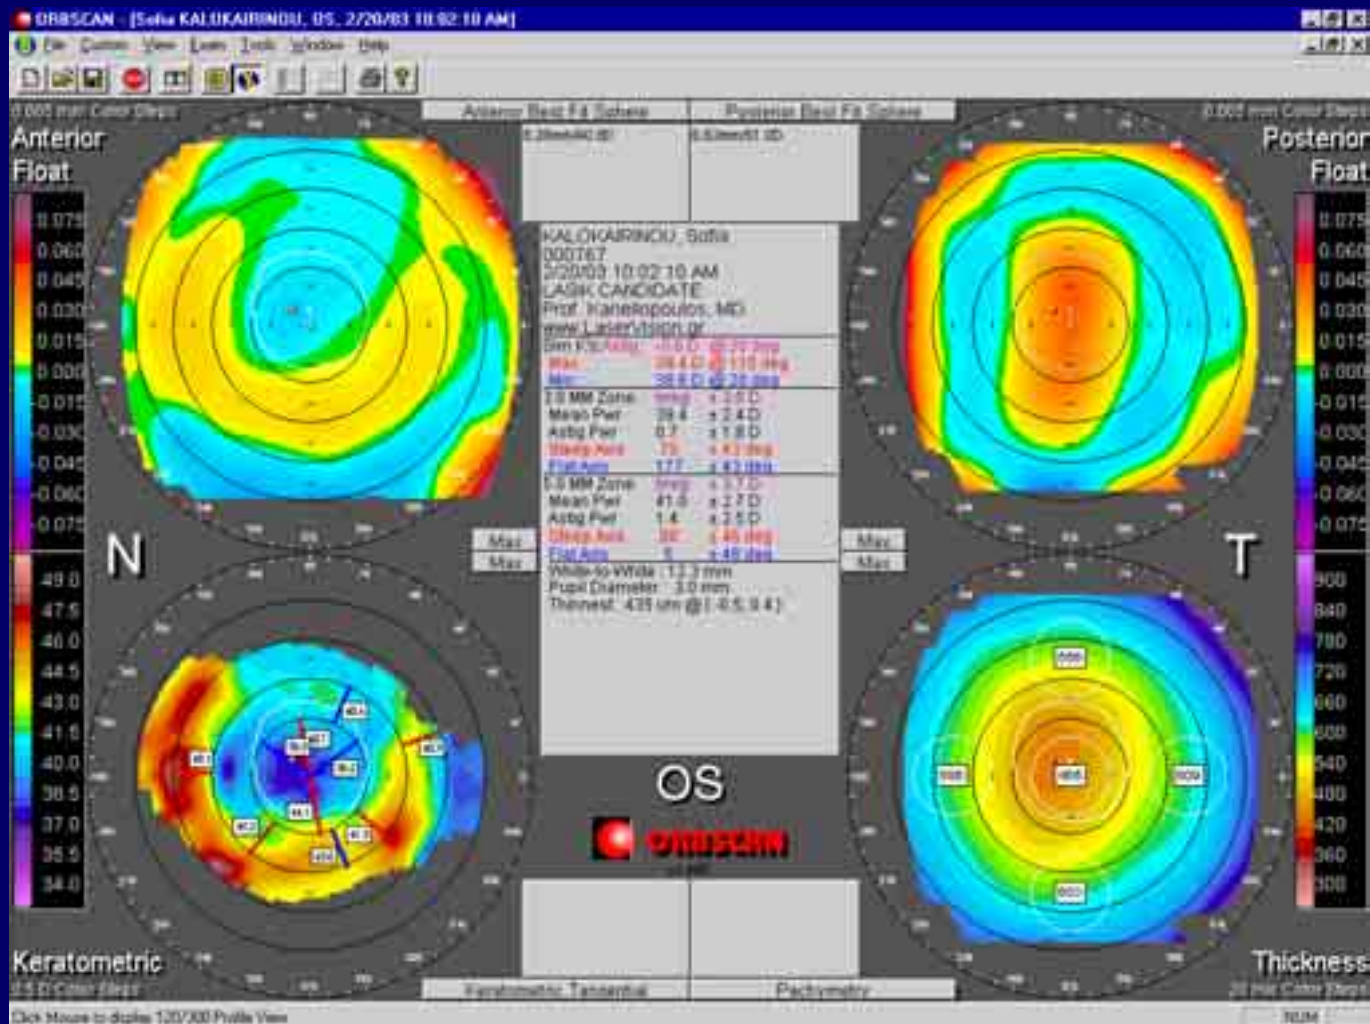

# Flap complications

- Re-treat in 2-3 months
- May need wavefront or topo-guided treatment
- Usually try THICKER flap with extreme K's
- Try placing the hinge at the steep meridian

# Total-free flap- case 3

# Post-op measurement-3months

# Undercorrection Case 4

- 28y/o F, had LASIK for  $-3.50$  OU, uneventful
- At 2 months, slightly undercorrected and night vision problems
- Underwent WG enhancement with great result

# Wavefront-guided enhancements

- Now 100% of our attempted enhancements
- Since flap is created already, little new aberrations expected
- Ability to treat decentrations and night vision problems
- Unhappy eye study with Wavelight

# Unhappy eye study with Wavelight

**Methods:** 26 consecutive eyes that had LASIK and were symptomatic, underwent wavefront-guided treatment, based on 4 reproducible aberration measurements. We evaluated pre-, and post-operative refraction, total and high order aberrations (RMSH), cornea and flap thickness, low contrast sensitivity (LCS) and possible complications. Follow-up was 3-7 months (4.5)

**Results:** 22 eyes were included. The mean values were: refractive error: sphere:  $-0,92D$  (plano to  $-1.50$ ) and cylinder:  $-0.85D$  (0 to  $-1,75$ ). UCVA improved from 20/25 to 20/18. There was no loss of BCVA in any case. The RMSH decreased from 0.62 to 0.25. LCS improved by 55%.

# Sample study cases

- 45 y/o male s/p LASIK for -5
- OD : plano, BCVA 20/25+, LCS C4
- OS: -0.50, BCVA 20/25+ LCS C5
- WG enhancement OU, 6.5mm OZ
- Post-op:
- OD UCVA 20/20, LCS C6
- OS UCVA 20/20, LCS C5

# Case #3

- Old LASIK when 20y/o
- Did well for 2 years then developed KCN picture
- Management with INTACS-very happy but large fluctuations of sphere (-2 to -8)
- Removed intacs placed ALTK sliver 120 microns
- Enhancement at 2 ms for -2.50-3.50 X 165
- 3 months post-op: 20/20

[www.brilliantvision.com](http://www.brilliantvision.com)

## Case # 4

- 65 y/o pseudophakic male
- Underwent LASIK for residual myopic astigmatism
- Developed pellucid-like peripheral thinning post-op UCVA 1/10 BCVA 6/10
- Had Aks initially that regressed
- Underwent ALTK with 250 graft
- Now UCVA 1/20, BCVA 10/10

# Post-LASIK ectasia

- Minimal stroma: 280
- Minimal total K: 420
- Beware that microkeratome may become unstable (usually they cut thinner though)
- Best treatment careful screening

Thank You

[www.brilliantvision.com](http://www.brilliantvision.com)

# Intrastromal Fungal keratitis following LASIK

*A. John Kanellopoulos, MD*

*Manhattan Eye, Ear and Throat Hospital*

[www.brilliantvision.com](http://www.brilliantvision.com)

# Background

- LASIK is becoming the most common surgical procedure Americans undergo.
- Considered relatively safe procedure in experienced hands
- Minimal epithelial defect is considered an advantage

# Background

- LASIK complications may be underreported
- Incidence of infection is speculated between 1/1000 to 1/5000 procedures
- Sterility measures during LASIK greatly vary

# Case 1

- 27 y/o M
- OD: -4.25 -0.25 X 35° 20/20, OS: -4.50 0.75 X 165° 20/20, underwent uneventful bilateral LASIK.
- Postoperative day 1: BCVA: 20/40 and 20/60 (OD/OS).
- There was +1 debris noted in the flap interface of the right eye, but both flaps were considered relatively clear.

# PO week 1:

- FBS OS. Two crystalline-like particles noted in the flap interface at the 9th and 2nd hour position at about equal distance from the optical axis in about a 4-5mm diameter

## Postoperative day 10:

- UCVA 20/25 OD ,20/100 OS PH 20/30.  
Increased interface debris.
- Flap culture/ irrigation
- Vancomycin, Sulfanicolle and Ofloxacin
- topical Ofloxacin, Sulfanicolle 8 times a day and PF QID.

POD 11: The infiltrates were noted to be reduced in size and thickness

# Post op w 2

[www.brilliantvision.com](http://www.brilliantvision.com)

# Post op w 3

[www.brilliantvision.com](http://www.brilliantvision.com)

# Follow-up PO Month 1

- Over the next 25 days 2 more washouts/cultures. *Acrimonium* grew from the first culture and Aphotericin A was included in the regimen

# Histo

# Histo

## Case 2

43y/o M O.D. -6.50 -1.00 X 175: 20/30,  
O.S. -4.25 -1.00 X 5 : 20/30.

Re-treatment OS after 6 months utilizing the same  
flap developed Candida infection

Therapeutic PK , UCVA 20/80 BCVA 20/40

# Case 2

[www.brilliantvision.com](http://www.brilliantvision.com)

## Case 3

28 y/o F OD:-7.75 -1.50 at 167

OS: -7.50 -1.00 at 180

PO Day 7 : Infiltrate OD at 12 o'clock gutter

Culture: Candida Rxed with Amphotericin a  
1%

4 months later PK, currently UCVA: 20/40

# Case 3

[www.brilliantvision.com](http://www.brilliantvision.com)

## Case 4

29y/o M OD: -12.75 -1.50 X 142 :20/25, and  
OS:-12.00 -1.00 at 60 degrees :20/25.

POW 1: Debris OD in the flap centrally and  
superiorly.

Flap was re-floated and irrigated X2

Therapeutic PK after 3 weeks: Fusarium

# Conclusions

- Interface fungal keratitis following LASIK is difficult to diagnose and treat
- Intrastromal contamination intraoperatively
- Sterility measures imperative

# Conclusions

- LASIK complications may be under-reported
- Prophylaxis is essential (Gram + eyelid flora), early infection suspicion
- Differential diagnosis for DLK, interface debris, ABT deposits
